## Thermo. Titr. Application Note No. H-009

## Title: $\quad$ Determination of Sulfate in Brines

Scope: $\quad$ Determination of the sulfate content of brines

| Principle: | An aliquot of brine is acidified with nitric acid and titrated <br> with standard barium chloride solution to a single <br> thermometric endpoint. In concentrated brines, the <br>  <br> endpoint is subject to some rounding. For accurate <br> results, it is necessary to determine the method blank on <br> aliquots of a sample brine solution. |
| :--- | :--- |

| Reagents: | Standard $1 \mathrm{~mol}^{\prime} / \mathrm{L} \mathrm{BaCl}$ |
| :--- | :--- |
| 2 | solution |
|  | $5 \mathrm{~mol} / \mathrm{L} \mathrm{HNO}$ |
|  | Anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$ A.R. |

| Method: | Basic Experimental Parameters: |
| :---: | :---: |
|  | Data rate (per second) 10 |
|  | Titrant delivery rate (mL/min.) 2 |
|  | No. of endothermic endpoints 1 |
|  | Data smoothing factor 55 |
|  | Procedure: |
|  | Pipette a 25.00 mL or 50 mL aliquot of brine into a titration vessel. Add $1 \mathrm{~mL} 5 \mathrm{~mol} / \mathrm{L} \mathrm{HNO}_{3}$, and titrate with $1 \mathrm{~mol} / \mathrm{L}$ $\mathrm{BaCl}_{2}$ solution to an exothermic endpoint. |
|  | Determination of method blank: |
|  | Titrate aliquots of $20,25,30,40$ and 50 mL of a selected typical brine sample according to Section 4.2. Subject the results to regression analysis, plotting aliquot volume on the $x$-axis and $\mathrm{BaCl}_{2}$ titre on the $y$-axis. The $y$-intercept is the method blank in mL , and must be subtracted from all titres. It will be noted in the example given here; the intercept is negative, meaning that this amount must be effectively added to the titre. |
|  | Standardization of $\mathrm{BaCl}_{2}$ titrant: |
|  | Dry anhydrous A.R. $\mathrm{Na}_{2} \mathrm{SO}_{4}$ for 2 hours at $200^{\circ} \mathrm{C}$. Cool in a dessicator. Weigh accurately 5 amounts ranging from approximately 0.13 g to 0.65 g in roughly equal increments directly into titration vessels. Add 30 mL D.I. water and 1 $\mathrm{mL} 5 \mathrm{~mol} / \mathrm{L} \mathrm{HNO}_{3}$ and titrate. Convert masses of $\mathrm{Na}_{2} \mathrm{SO}_{4}$ titrated to mmole, and plot on the $x$-axis, with |

corresponding titres of $\mathrm{BaCl}_{2}$ on the y-axis. Perform a regression analysis, and compute the gradient of the regression curve. The molarity of the $\mathrm{BaCl}_{2}$ is the reciprocal of the gradient. In this instance, the y-intercept is not used as the method blank, due to the need to match the sample matrix.

| Results (Example): | Analysis of brines: |  |  |
| :---: | :---: | :---: | :---: |
|  | Sample No. | Sample Aliquot, mL | Sulfate as $\mathbf{S O}_{4}{ }^{2-}, \mathbf{g} / \mathrm{L}$ |
|  | 1 | 50 | 4.73.4.75 $\varphi=4.74$ |
|  | 2 | 20-50 | $\begin{aligned} & 12.16,12.13,12.17,12.14, \\ & 12.08 \varphi=12.14, \text { S.D. }= \\ & 0.033 \end{aligned}$ |
|  | 3 | 50 | 2.80, $2.77 \varphi=2.79$ |
|  | 4 | 25 | 7.70, $7.70 \varphi=7.70$ |
|  | 5 | 25 \& 50 | $3.10,3.14,3.11 \varphi=3.12$ |

| Determination of Method Blank (Example based on sample \#2) |  |  |
| :---: | :---: | :---: |
| (see Fig. 1) | Sample aliquot volume, mL | Titre $\mathrm{BaCl}_{2}, \mathrm{~mL}$ |
|  | 20 | 2.533 |
|  | 25 | 3.155 |
|  | 30 | 3.792 |
|  | 40 | 5.032 |
|  | 50 | 6.330 |

| Standardization of $\mathrm{BaCl}_{\mathbf{2}}$ Titrant |  |  |  |
| :--- | :---: | :---: | :---: |
| (see Fig. 2) | Mass of $\mathbf{N a}_{\mathbf{2}} \mathbf{S O}_{\mathbf{4}}$ <br> $\mathbf{g}$ | \begin{tabular}{c}
\end{tabular}Equiv. $\mathbf{~ m m o l e ~}$ <br> $\mathbf{N a}_{\mathbf{2}} \mathbf{S O}_{\mathbf{4}}$ | $\mathbf{B a C l}_{\mathbf{2}}$ titre, $\mathbf{m L}$ |
|  | 0.1320 | 0.925 | 1.012 |
|  | 0.2690 | 1.884 | 1.971 |
|  | 0.5444 | 3.813 | 3.909 |
|  | 0.4119 | 2.885 | 2.986 |
|  | 0.6662 | 4.667 | 4.751 |

* Assumes reagent purity of $99.5 \%$

Fig.1. Regression analysis to determine method blank $y$-intercept $=$ method blank $=-0.0017 \mathrm{~mL}$

Fig. 2. Regression analysis to standardize $\mathrm{BaCl}_{2}$
Molarity $=1 /$ gradient $=1 / 1.0004=0.9996 \mathrm{~mol} / \mathrm{L}$

## Calculation:

$\mathrm{SO}_{4}^{2-} g / L=\frac{\left((\text { titre }, m L-\text { blank, } m L) \times \mathrm{M} \mathrm{BaCl}_{2} \times \mathrm{FW} \mathrm{SO}_{4}^{2-}\right)}{\text { sample volume, } \mathrm{mL}}$
Example:
$S O_{4}^{2-} g / L=\frac{((2.004-(-0.0017)) \times 0.9996 \times 96.058)}{25.00}$
$=7.70$
