Triple certification

Agilent is committed to product integrity by offering customers the assurance of triple certification to ISO standards.

Agilent operates under an ISO 9001 registered quality management system, where an accrediting body (TUV) attests to the quality of our methods, procedures, testing, production, and record keeping.

Our quality control laboratory is accredited to ISO 17025 (ANAB) for technical competence to perform testing of organic and inorganic materials and certified reference materials, as defined in our scope, accessible online at www.agilent.com/chem/17025

Agilent is further accredited to ISO Guide 34 (ANAB) for technical competence as a reference material producer of certified reference materials. This requires Agilent to identify and document the major components of uncertainty including homogeneity, short- and long-term stability, and uncertainty due to analytical characterization and manufacturing.

The most current Agilent certifications are accessible at www.agilent.com/quality

Kansas – TPH method

Determination of midrange hydrocarbons (MRH) and high-range hydrocarbons (HRH)

This method collectively quantitates extractable petroleum hydrocarbons within two ranges: midrange hydrocarbons (C_9 – C_{18}) and high-range hydrocarbons (C_{19} – C_{35}). Solvent extraction followed by GC/FID analysis is used to measure the total concentration of extractable petroleum hydrocarbons in water and soil/sediment matrices.

Shooters – Open and shoot spiking standards

No dilution required

Shooters are ready-to-shoot spiking solutions at the working concentrations specified by the EPA methods. Just open the bottle and spike the sample. Since these working level solutions are packaged in convenient bottles, rather than ampoules, follow the EPA protocols for storage and stability checking of working standards. See the EPA method you are using for the specific protocol.

EPA Method 1664A

Oil and grease, and total petroleum hydrocarbons

Method 1664A is a gravimetric method for the determination of n-hexane extractable material (HEM) in surface and saline waters, and in industrial and domestic aqueous wastes. Extractable materials that may be determined are relatively nonvolatile hydrocarbons, vegetable oils, animal fats, waxes, soaps, greases, and related materials.

EPA Method 418.1

Oil and grease, and total petroleum hydrocarbons

Method 418.1 is a method for determining TPH using a freon (CFC-113) as the extraction solvent. After extraction, polar components are removed by adsorption on silica gel, and the remaining components are measured by infrared spectrometry (IR). Method 418.1 was withdrawn by the EPA due to the use of a fluorocarbon extraction solvent. Although Method 418.1 is no longer an approved EPA method, Agilent continues to offer this standard for your convenience.

Technical note

These standards often crystallize while standing. Always check for crystals before use. For best results, always equilibrate the standards in an ultrasonic bath to ensure complete dissolution.

Weathered hydrocarbon fuel standards

Weathered fuels

The Agilent weathered fuel standards are designed to simulate the effects of exposures on hydrocarbon fuel samples. The standards are prepared by evaporation of the low boiling components of the fuel sample until the desired percentage reduction is achieved. Matrix effects have not been simulated.
