Market Situation

The world of He supply is not reliable and becoming more scarce, prices are increasing, and customers are seeking alternative carrier gases.
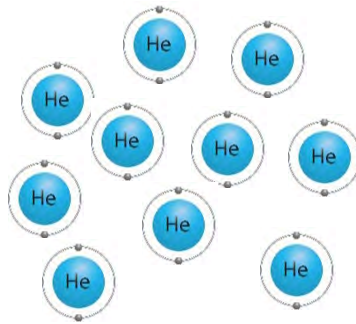

Researchers have a need to find suitable alternatives to either eliminate or reduce He consumption.

Webinar Outline

- Use of Gas Saver

- Hydrogen safety

- Carrier gas decision tree
  - Decision making guide to fit your carrier gas requirements

- Migrating existing helium GC methods to H_2 or N_2
  - Best practices to obtain the same results and minimize method revalidation

- Helium conservation
  - Smarter helium use with new hardware/software tools
  - No need to revalidate existing GC methods

- Cautions about making the switch to Hydrogen for MSD systems

How to Combat the Helium Shortage
DE93753203

Agilent

Have You Ever Noticed the Gas Saver Section of the Inlet Method Editor?

How to Combat the Helium Shortage
DE93753203

Why Would I Want to Use Gas Saver?

- When enabled, GC automatically runs Gas Saver
  - Beneficial when using split mode

- Gas Saver mode turns **on** after injection
  - Turns **off** during the prep run and injection duration

- Lowers the use of carrier gas to save helium (or other carrier gas) and cuts costs
- Ensures it is not actually using more gas (low split ratio)
- Suggested parameters
  - Flow – No lower than 15 mL/min
    Recommended: ~20 mL/min
  - Time – ~2 to 5 minutes

Carrier Gas Decision Tree
Migrating GC methods to nitrogen and hydrogen

No ← **Is the customer willing to convert to alternative gasses?** → Yes

GC ← **Is the application based on GC or GC/MS?** → GC/MS

Does the current GC method have more than enough resolution? → No

Yes

He Conservation

Consider migration to N$_2$

Consider migration to H$_2$

GC/MS specific H$_2$ considerations

How to Combat the Helium Shortage
DE93753203

Agilent
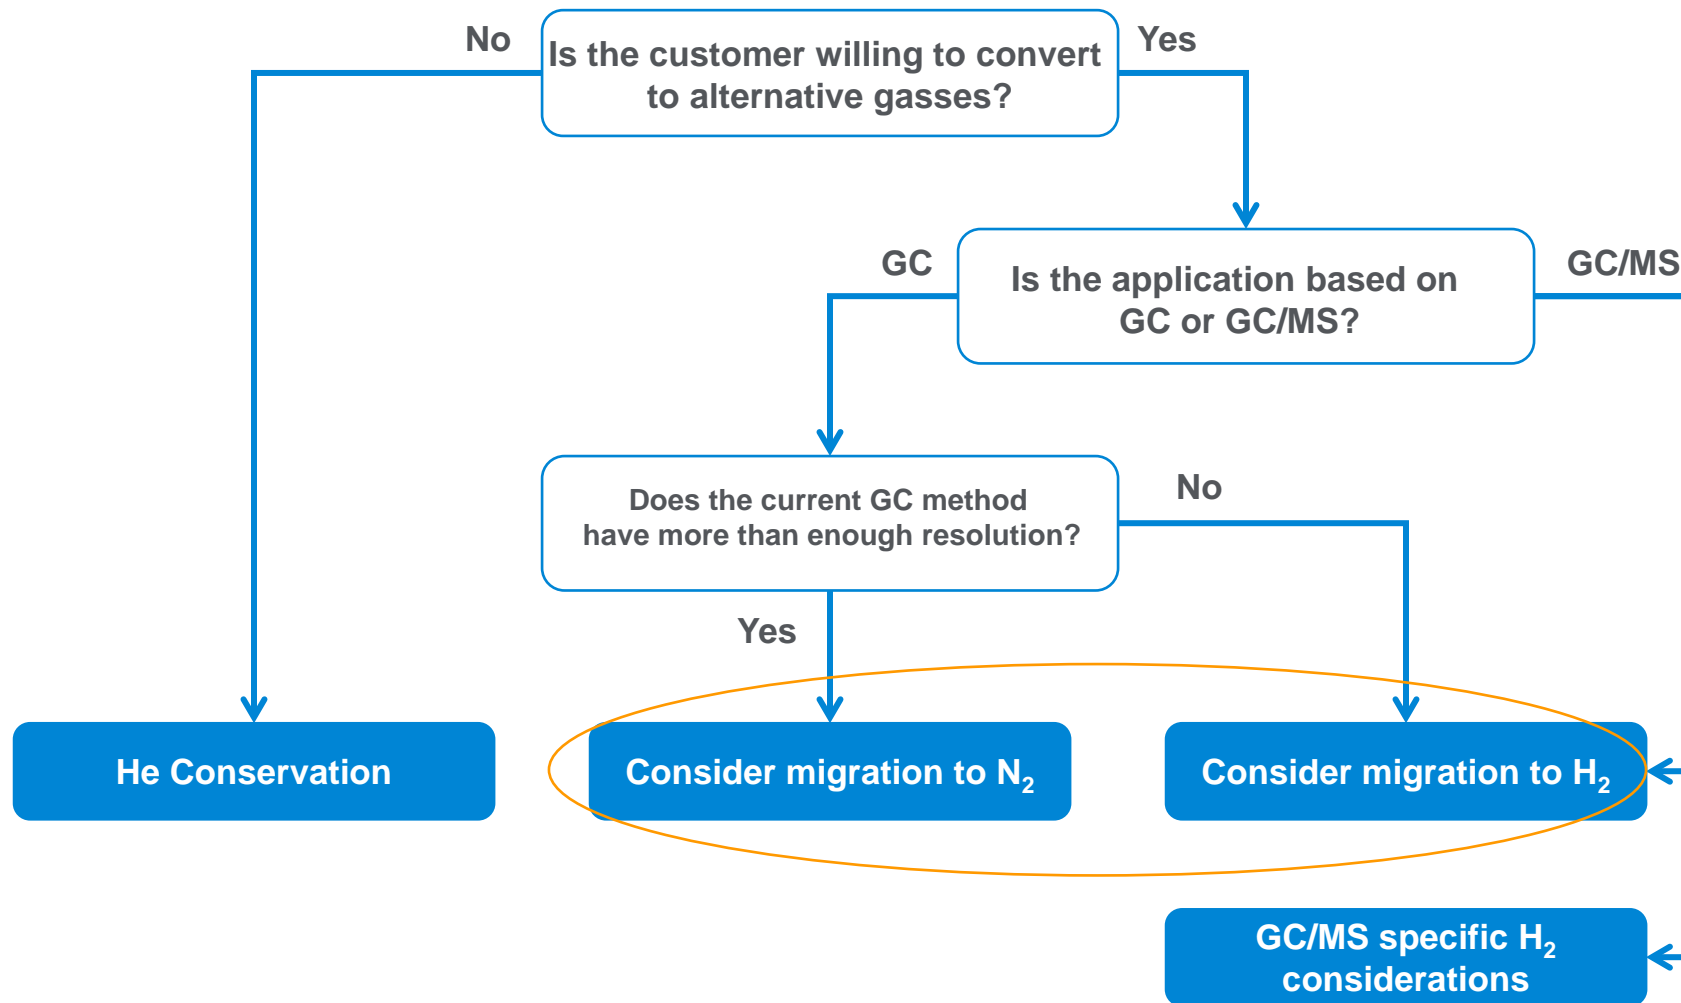

Safety Considerations for Hydrogen Migration

Both GC and GC/MS offer H_2 enabled features:

Safety shutdown

- When gas pressure setpoints are not met, the valve and heater are shut off to prevent an explosion

Flow limiting frit

- If valve fails in open position, inlet frit limits the flow

Oven ON/OFF sequence

- Fan purges the oven before turning on heater to remove any collected H_2

Explosion "ready"

- GC and MS designed to contain parts in case of explosion (for example, spring in GC door)

H_2 sensor available

- https://www.agilent.com/en/products/gas-chromatography/gc-systems/7890b-gc-system/h2sensor

Read the hydrogen safety guide:
https://www.agilent.com/cs/library/usermanuals/public/Hydrogen.pdf

Agilent

Considerations for Hydrogen Gas Sources

H_2 generator – preferred

- Very clean H_2, >99.9999% available
- Consistent purity
- Built-in safety features
- Make sure to buy a good generator with a low spec for water and oxygen
- Parker's H-MD are used at Agilent sites
- Use Gas Clean filter

H_2 cylinder

- Use Gas Clean filter
- Possible to add safety device
  - https://www.agilent.com/en/products/gas-chromatography/gc-systems/7890b-gc-system/h2sensor

Considerations for Hydrogen Gas Plumbing

Tubing

- Use chromatographic quality stainless steel tubing (recommended)
- Do not use old tubing (H_2 is known as scrubbing agent)
- Especially don't use old copper tubing (brittleness is a safety concern)

Venting

- Connect split vent and septum purge vent to exhaust

Leak checking

- Recommend G6696A / G6693A leak detector (pub # 5994-4202EN)
- Is a Leak Causing Your Inaccurate Results? Agilent CrossLab CS Electronic Leak Detector

H_2 sensor available

- https://www.agilent.com/en/products/gas-chromatography/gc-systems/7890b-gc-system/h2sensor

Use N$_2$ As Carrier Gas

Many HPI methods suited to nitrogen

- Readily available and less expensive gas
- No safety concerns
- Suitable for simple routine analysis (with sufficient resolution)
- More inert than H$_2$, especially with PLOT/micropacked columns
  - Some compounds catalytically reduced in H$_2$
- 2-D GC ideally suited to nitrogen
  - Resolution issues solved using two different columns

Potential issues

- Reduced chromatographic resolution at higher flows
- Not suitable for GC/MSD and certain GC detector applications

R = ?

R = 1.17

R = 1.37
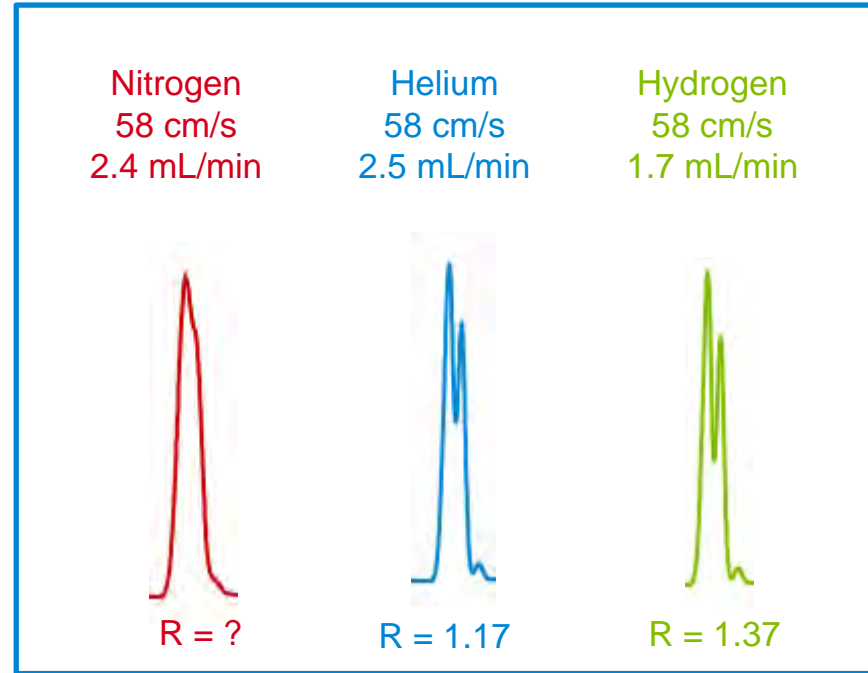

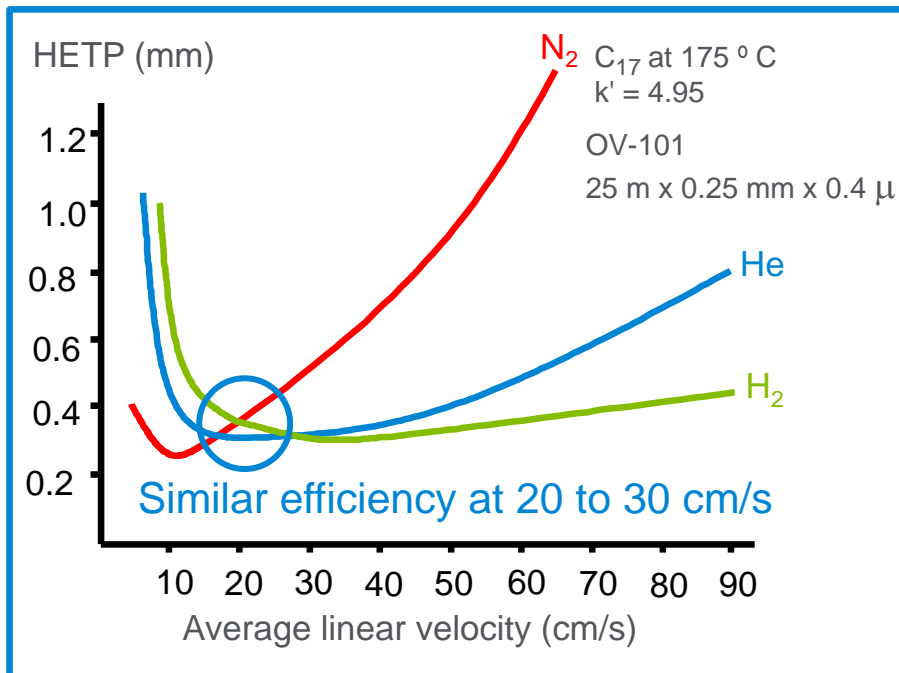

- N_2 actually provides the best efficiency, but at a slower speed
- Most helium methods have too much resolution
  - Lower N_2 efficiency at higher flows can still provide "good enough" resolution
- Most GC methods now use constant flow
  - N_2 efficiency losses with temperature programming are not as severe

How to Combat the Helium Shortage
DE93753203

Agilent

Helium Carrier Gas Alternatives
Important theoretical considerations relating to peak efficiency

Sharp, narrow peaks in a chromatogram is an indication of a high **efficiency** GC column.

- Remember that **efficiency** is represented mathematically by the symbol "*N*" called *Theoretical Plates*, and that the larger *N* is, the better the resolving power of the column (i.e., higher resolution).
- **Resolution** is described mathematically by the symbol R_s and its numeric value tells how well two adjacent peaks are separated from each other.

$$R_s = \frac{\sqrt{N}}{4}\left(\frac{k}{k+1}\right)\left(\frac{\alpha-1}{\alpha}\right)$$

A resolution value of 1.5 tells us that two peaks are baseline separated. The greater (higher) the R_s value, the more separation that has been achieved.

Calculating efficiency

Start
Inert gas
t_m t_R Solute
t_R
Time

Let's relate "n" to the length of the column.

Plates per meter $(N) = \dfrac{n}{L}$ or

Height equivalent to a theoretical plate $(HETP) = \dfrac{L}{n}$

We would like to know the actual time the component spends in the stationary phase.

$$t_R' = t_R - t_m \qquad n = 5.545\left(\frac{t_R'}{W_h}\right)^2$$

t_R' = corrected retention time.

n = effective theoretical plates.

Thus, the more efficient the column, the bigger the "N" the smaller the "HETP".

Efficiency and carrier gas linear velocity

$$HETP = A + \frac{B}{\mu} + C\bar{\mu}$$

HETP
MOLECULAR DIFFUSION B
} C RESISTANCE TO MASS TRANSFER
} A EDDY DIFFUSION
$\bar{\mu}$ (opt μ)

Efficiency is a function of the carrier gas linear velocity or flow rate.

The minimum of the curve represents the smallest HETP (or largest plates per meter) and thus the best efficiency. "A" term is not present for capillary columns.

- Plot of HETP versus linear velocity is know as the **Van Deemter** plot.
- The linear velocity value at the minimum of the curve is the optimum value for achieving the best efficiency.

Helium Carrier Gas Alternatives
Let's make this easy

- Goal: Change carrier gas while keeping other method conditions the same
  - Use the same column
  - Use the same oven program
  - Adjust column flow or holdup time to:
    - Maintain same peak elution order
    - Maintain same peak retention times (or as close as possible)

- Easier method revalidation using this approach
  - Minimal changes to timed integration events
  - Minimal changes to peak identification table

- For N_2, test resolution of key components
  - Adjust GC conditions (temperature, flow) if needed

Many Helium GC Methods Have Excess Resolution
EN14103 – GC analysis of FAME content in biodiesel

Migrating GC methods to nitrogen and hydrogen

No — **Is the customer willing to convert to alternative gasses?** — Yes

GC — **Is the application based on GC or GC/MS?** — GC/MS

Does the current GC method have more than enough resolution? — No

Yes

He Conservation

Consider migration to N$_2$

Consider migration to H$_2$

GC/MS specific H$_2$ considerations

How to Combat the Helium Shortage
DE93753203

Agilent
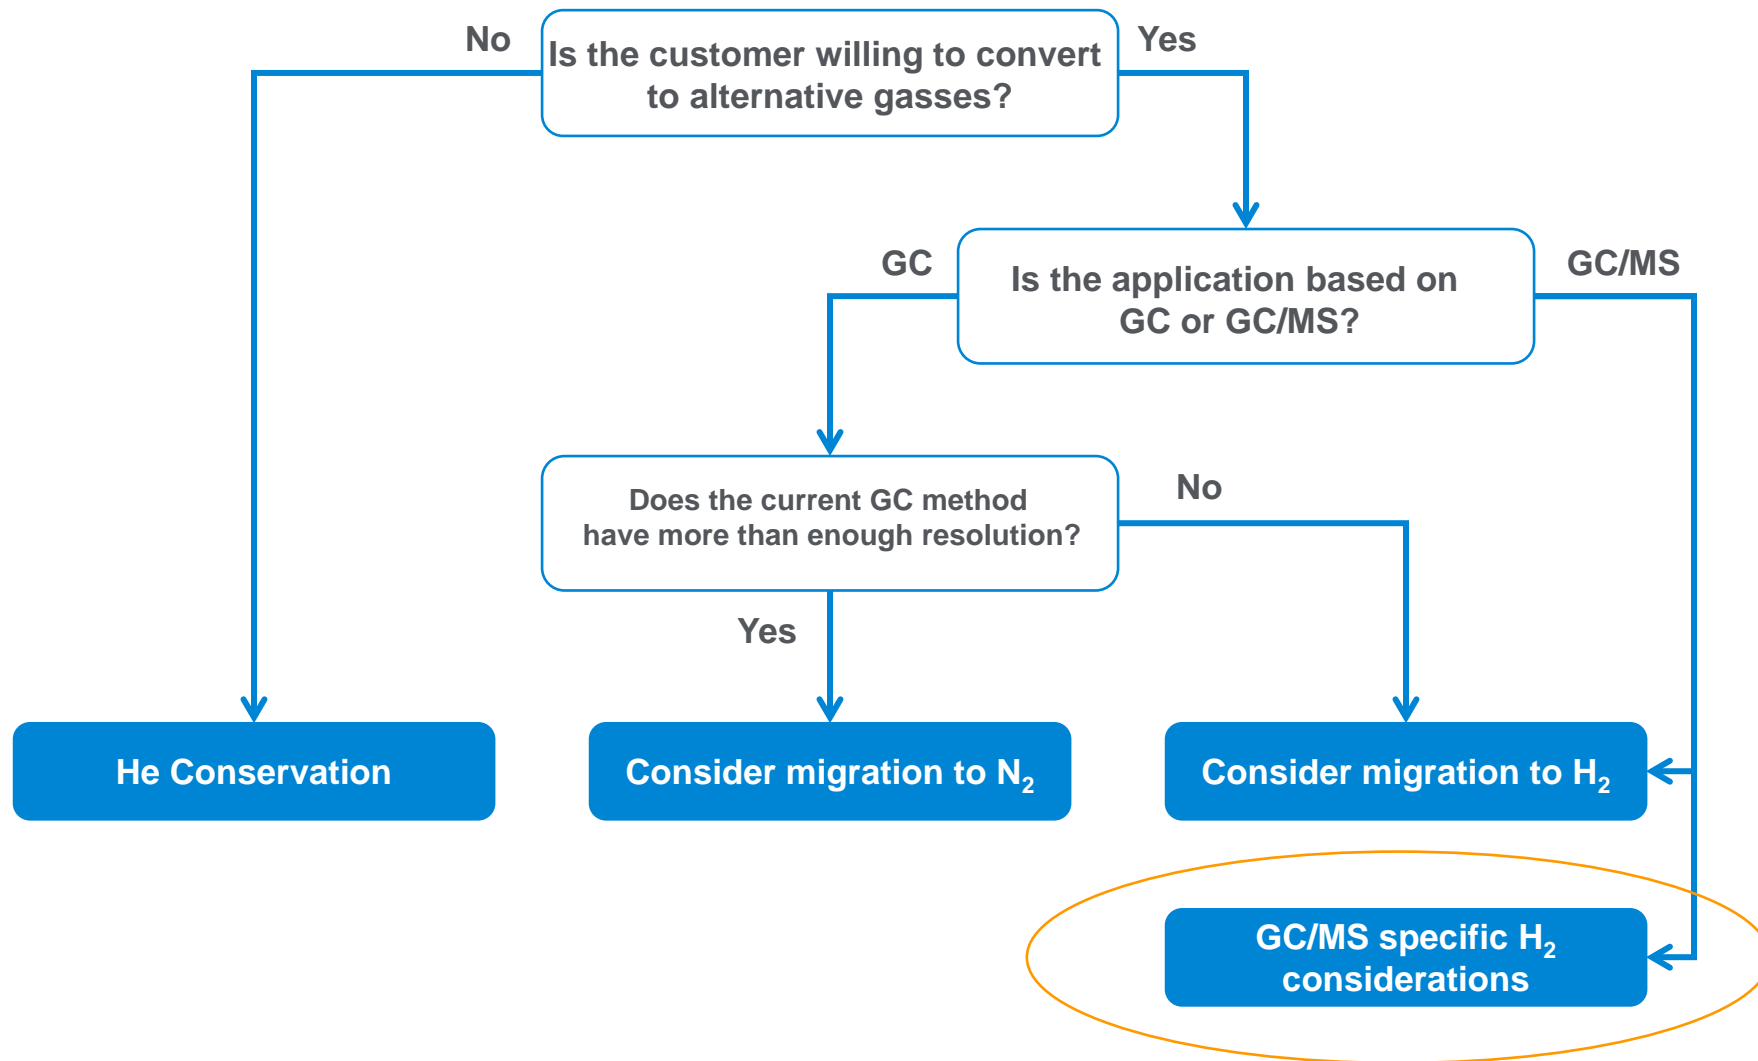

MSD Systems: **Do Not** Switch from He to H_2 Unless Absolutely Necessary

- Hydrogen is a reactive gas!

- You **will** experience a noisy/elevated background that can be persistent (days/weeks/longer?)

- Chemical reactions happen in the inlet, column, and sometimes the source that can change your results.

- **Every** analyte in **every** matrix in **every** method will need to be validated using hydrogen to make sure there are no chemical reaction problems (unlike using a Helium conservation module)

- Looking for untargeted unknowns is problematic due to the possibility of reactivity.

- Library search match quality will be impacted.

- Tuning results will be different than with helium. Some tunes, notably BFB and DFTPP, may not pass

- **First, try all helium conservation measures instead of switching to H2.**

*There are no published performance specifications for any current Agilent GCMS system using hydrogen carrier gas.

MSD: Converting from He to H$_2$ Carrier Gas

- Many GC/MS users are considering changing from helium to hydrogen

- carrier gas due to price/availability problems with helium.
  - Read Chemical and Engineering News - July 16, 2012 (Page 32-34)

- It is important to recognize the differences with using hydrogen carrier. Time should be allotted for adapting the method, optimization, and resolving potential problems. Areas that will need attention include:
  - choice of supply of H$_2$
  - GC/MSD hardware changes
  - choosing new chromatographic conditions
  - potential reduction in signal-to-noise ratio (2-5x or more) due to higher noise
  - changes in spectra and abundance ratios for some compounds
  - activity and reactivity with some analytes

*There are no published performance specifications for any current Agilent GCMS system using hydrogen carrier gas.

Agilent

Carrier Gas Decision Tree
Continue using helium, but in a smarter way

No ← **Is the chemist willing to convert to alternative gasses?** → Yes

GC ← **Is the application based on GC or GC/MS?** → GC/MS

Does the current GC method have excess resolution? → No

He conservation

Method revalidation not required

Yes → **Consider migration to N$_2$**

Consider migration to H$_2$

GC/MS specific H$_2$ considerations
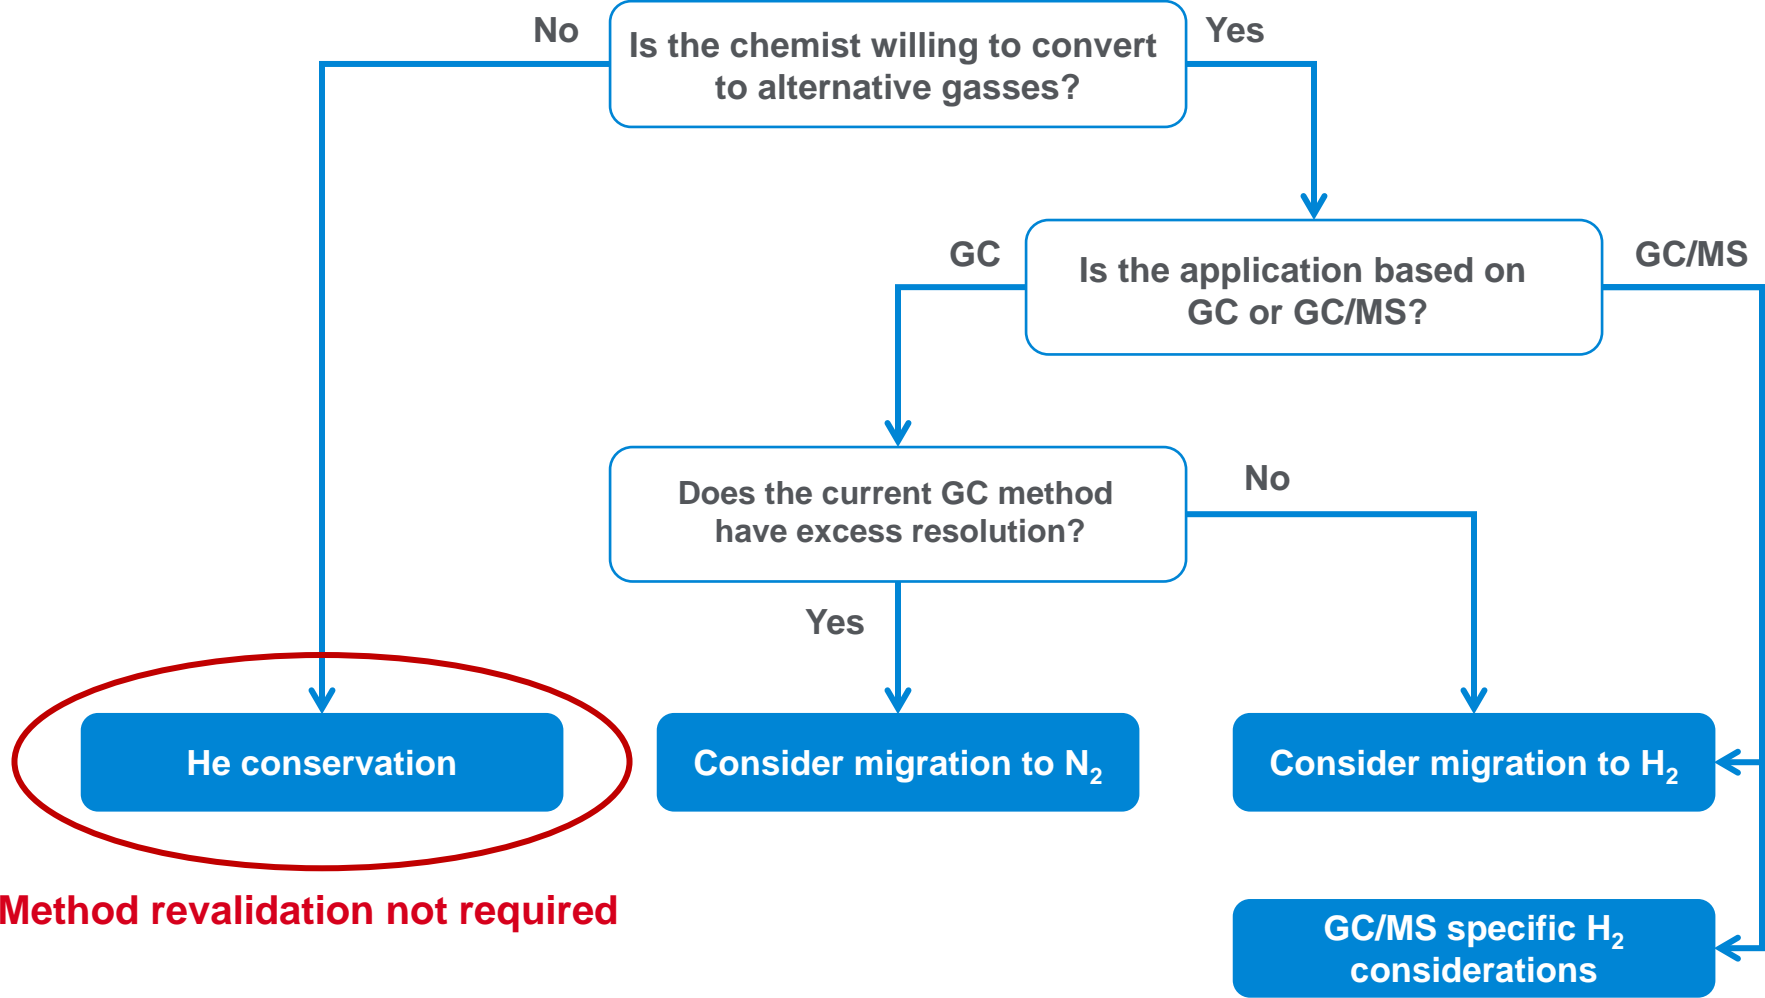

Reducing Helium Use With Conservation

Programmable helium conservation module (available for Agilent 7890B, 8860, 8890 GC systems including MSD)

- Automatically switches carrier gas supply to N_2 standby during idle time

- Integrates into the Sleep and Wake function of the GC

- Combined with Helium Gas Saver to **greatly** reduce helium consumption

- Better alternative to just "shutting off the GC"
  - No system contamination with ambient air exposure
  - Faster restart of heated zones

- System setup
  - H$_2$ safety, H$_2$ source, gas connection, system clean up
- Method migration
  - Method transfer SW, method migration consideration, revalidation
- GC/MS analytical performance expectation
  - Sensitivity impact, MS spectrum impact, analyte compatibility
- For more details
  - C&EN webinar on October 9, 2012
  - Recorder session: http://cen.acs.org/media/webinar/agilent_100912.html

Summary: Helium Conservation Benefits

- Seamless integration
  - No need to revalidate existing GC methods
  - Fully integrated with Agilent 7890B and CDS (OpenLab, Mustang, MassHunter)
  - Carrier gas ID and setpoints are a part of the method for compliance and transfer
  - Easily implemented using new Agilent Sleep/Wake functions

- Greater reliability
  - Based on proven 5th generation AUX EPC
  - Agilent 7890/8890 provides warning if setpoints are not reached
  - For hydrogen users, nitrogen substitution when not running GC

- Greater performance
  - Purge channel prevents cross contamination of gases
  - Delivers more stable gas pressure control from the tank regulator to the inlet EPC module
  - Acts as an intermediate pressure regulator from the tank to inlet EPC to ensure greater analytical precision

Summary – Migration to H_2 and N_2

- Don't forget about Gas Saver
- Be especially cautious when migrating to H_2 with an MSD system
  - Generally, not recommended
- For high resolution methods, H_2 offer the best alternative
  - Agilent GC and GC/MS systems have many built-in safety features

- For many GC applications, N_2 offers a cheap, easy alternative without any safety worries
  - Many existing helium methods have too much resolution
  - N2 can be used without changing any of the existing GC conditions
    - Keep the holdup time the same as the original method
  - 2-D methods have high resolution built in, so N2 is ideally suited as a carrier gas
    - Valve-based or Deans switch (not GC x GC flow modulation)
- For more information on Helium Carrier Gas: www.agilent.com/chem/heliumupdate
