Analysis of Polysorbate 80 in IgG Aqueous Solution by Online SPE Using a Shim-pack MAYI Column – Part 2

Polysorbates play a role in maintaining the stability of proteins to prevent their denaturation, so they are often added to protein formulations. Therefore, evaluation of the quality and stability of these formulations also requires evaluation of the quality of the polysorbate. A polysorbate is not just a mixture of polyoxyethylene sorbitan fatty acid esters with polyoxyethylene chains of different degrees of polymerization. It has a complex composition which includes a variety of by-products as impurities, and those are said to affect the stability of protein formulations. Thus, it is believed that utilizing the high resolution offered with an HPLC coupled with a mass spectrometer can provide effective monitoring of quality.

In Application News No. L486, a method in which automated deproteinization can be conducted followed by quantitative analysis of polysorbate 80 in an antibody model sample was presented. Here, using this system for higher resolution analysis, we conducted detection and mass spectral measurement of possible by-product components of polysorbate 80.

Analysis of Antibody Model Sample

In accordance with the analytical conditions of Table 1, a model sample (20 mg/mL lgG) spiked with 100 μ g/mL of polysorbate 80 was injected.

Column: Shim-pack MAYI-ODS $(5 \text{ mm L} \times 2.0 \text{ mm I.D.}, 50 \mu \text{m})$ Mobile Phase: A: 10 mmol/L Ammonium Formate in Water B: 2-PropanolTime Program: Solvent switching $A (0 - 3.5 \min) \rightarrow B (3.5 - 5 \min) \rightarrow A (5 - 110 \min)$ Elowrate: 0 6 ml /min (0 - 5 min 95 01 - 110 min)		
Mobile Phase :A: 10 mmol/L Ammonium Formate in Water B: 2-Propanol Time Program : Solvent switching A (0 - 3.5 min) \rightarrow B (3.5 - 5 min) \rightarrow A (5 - 110 min) Flowrate : 0.6 ml /min (0 - 5 min) 95 01 - 110 min)	Column	Shim-pack MAYI-ODS
Time Program: Solvent switching $A(0 - 3.5 \text{ min}) \rightarrow B(3.5 - 5 \text{ min}) \rightarrow A(5 - 110 \text{ min})$ Elowrate: 0.6 ml /min (0 - 5 min 95 01 - 110 min)	Mobile Phase	: A: 10 mmol/L Ammonium Formate in Water B: 2-Propanol
Elowrate : 0.6 ml /min (0 = 5 min 95 01 = 110 min)	Time Program	: Solvent switching $A(0 - 3.5 \text{ min}) \rightarrow B(3.5 - 5 \text{ min}) \rightarrow A(5 - 110 \text{ min})$
0.1 mL/min (5.01 - 95 min)	Flowrate	: 0.6 mL/min (0 - 5 min, 95.01 - 110 min) 0.1 mL/min (5.01 - 95 min)
Extraction Time : 3 min Injection Vol. : 5 µL Column Temp. : 40 °C	Extraction Time Injection Vol. Column Temp.	: 3 min : 5 µL : 40 ℃
Detection : UV280 nm (Semi-micro cell)	Detection	: UV280 nm (Semi-micro cell)

After about 3 minutes, switching was made to include the pretreatment column in the analytical flow line, and polysorbate 80 began to elute from that column. In this case, separation with a more gradual gradient elution was achieved using an analytical column longer than that used in quantitative analysis (Application News No. L486). For detection, the LCMS-8050 was used (Fig. 1, Table 2). Fig. 2 shows the TIC chromatogram in which elution is achieved with an especially gradual slope and retention times up to 35 minutes.

Confirmation of Mass Spectra

The TIC chromatogram is shown in Fig. 5, and the mass spectra are shown in Figs. 3, 4 and 6. Peak D, observed as the principle component in the TIC chromatogram, matched the quantitation target substance discussed in Application News No. L486, as well as the spectrum. Regarding peak A, peaks with mass differences of 44 and 22 are singly and doubly charged ions, and from the literature, it is presumed that they are derived from polyoxyethylene isosorbide and polyoxyethylene. Peak E eluting in the second half showed a similar spectrum, and is assumed to be an ester of this substance.

Fig. 3 Mass Spectrum of the Peaks (A)

As for peak B, it is detected as a divalent and trivalent peak similar to the principal component peak D, and is presumed to be polyoxyethylene sorbitan derived from hydrolysis of the ester according to the literature.

Regarding the mass spectra of peaks C, F, and G associated with components eluted in the latter half, this series has the same features, in which the oleic acid bond number and fatty acid type are different from those of the principal component.

Fig. 4 Mass Spectrum of the Peaks (B)

Fig. 6 Mass Spectra of the Peaks (C - G) in Fig. 5

The results showed that the online SPE system combined with high-resolution analysis allows identification and quantitation of each by-product, and that this system can be further applied to monitor degradation due to oxidization or hydrolysis.
